EXECUTIVE SUMMARY

At Risk

$500,000	$45,000	17 yrs	34/100	32/100
Starting Portfolio	Annual Withdrawal	Years Lasting	Sustainability Score	Withdrawal Pressure Score
			At Risk	**Elevated Pressure**

ESTIMATED WITHDRAWAL BREAKDOWN (PROJECTED)

Total projected: $500,000

- Est. Total Withdrawn: $956,250 (100.0%)
- Remaining Balance: $0 (0.0%)

AI-ASSISTED WITHDRAWAL SUSTAINABILITY SUMMARY

Based on a starting portfolio of $500,000 with annual withdrawals of $45,000 (9.0% first-year withdrawal rate), the simulation projects 17 years of sustainable withdrawals at 5% annual return and 3% inflation. The portfolio is estimated to be depleted at age 79 after 17 years of withdrawals. Sustainability Status: At Risk (Score: 34/100).

A first-year withdrawal rate of 9.0% is elevated. Rates above 5% significantly increase the risk of portfolio depletion, particularly over 25+ year horizons. With 3% annual inflation, your $45,000 first-year withdrawal grows to approximately $58,715 at year 10, $78,908 at year 20, and $106,045 at year 30. Withdrawal Pressure Score: 32/100 (Elevated Pressure).

This simulation uses a fixed annual return of 5% and does not account for Social Security, pension income, taxes on withdrawals, or RMD requirements. Actual portfolio longevity depends on market variability, tax treatment, and income from other sources not modeled here.

INPUTS & ASSUMPTIONS

Starting Portfolio	**$500,000**
Annual Withdrawal	**$45,000**
Assumed Annual Return	**5%**
Inflation Rate	**3%**
Current Age	**62**
Withdrawal Start Age	**65**
Target Ending Balance	**$0 (deplete fully)**
Withdrawal Timing	**End of Year**
Region	**United States**

DETAILED RESULTS

Years Lasting	17
Depletion Age	Age 79
First-Year Withdrawal Rate	9.0%
Sustainability Status	At Risk
Sustainability Score	34/100
Withdrawal Pressure Score	32/100 (Elevated Pressure)
Est. Total Withdrawn	$956,250
Remaining Balance	$0
Withdrawal at Year 10	$58,715.00
Withdrawal at Year 20	$78,908.00
Withdrawal at Year 30	$106,045.00

KEY DRIVERS / POSSIBLE ADJUSTMENTS

- A first-year withdrawal rate of 9.0% is the primary longevity driver. Reducing withdrawals by even 0.5% per year can materially extend portfolio life.
- Your 3% inflation assumption means withdrawals nearly double every 24 years under the Rule of 72. Inflation is a significant long-term portfolio drain.
- The portfolio depletes at age 79. Consider part-time income, delaying withdrawals by more years, or a lower withdrawal rate to extend longevity.

METHODOLOGY

What this calculator models:

- Simulates year-by-year portfolio withdrawals starting at age 65, applying 3% annual inflation to increase withdrawal amounts each year. Withdrawal timing is end-of-year.
- Applies 5% fixed annual return to the portfolio balance before or after withdrawals, depending on the selected timing. The simulation runs for up to 50 years or until the portfolio falls to the target ending balance.
- Sustainability Score is based on years the portfolio lasts (0-100 scale). Withdrawal Pressure Score is based on the first-year withdrawal rate independent of the simulation outcome.

What this calculator does not model:

- Social Security or pension income offsets.
- Federal or state taxes on withdrawals.
- Required Minimum Distributions (RMDs).
- Employer pension or defined-benefit income.
- Sequence-of-returns risk or variable returns.
- Fees or investment costs.

EDUCATIONAL DISCLAIMER

This report is for educational and illustrative purposes only. Results are based on fixed assumed return and inflation rates and do not reflect Social Security, pension income, Required Minimum Distributions (RMDs), or taxes on withdrawals. Actual portfolio longevity will vary based on market returns, tax treatment, and personal circumstances. This does not constitute financial, tax, or retirement planning advice. Consult a qualified financial advisor before making withdrawal decisions.
