EXECUTIVE SUMMARY

Moderate Interest Burden

$8,500	$350.00	33 mo (2 yr 9 mo)	$3,050	March 2029
Balance	Monthly Payment	Months to Payoff	Total Interest	Debt Free Date

TOTAL PAYMENT BREAKDOWN

74% | 26%

Total projected: $11,550

Principal: $8,500 (73.6%)

Total Interest: $3,050 (26.4%)

AI-ASSISTED DEBT PAYOFF SUMMARY

With a $8,500 balance at 22.99% annual interest, your $350.00/month payment pays off the debt in 2 yr 9 mo (by March 2029). Total paid: $11,550. Total interest: $3,050 (26.4% of total cost). Monthly interest charge in month 1: $162.85.

Acceleration opportunity: With your extra $100.00/month (total $450.00/month), you pay off in 2 years (by June 2028), saving $750 in interest. In month 1, $187.15 of each payment reduces the principal and $162.85 covers interest. As the balance falls, more of each payment goes to principal.

Interest rate (22.99%) is the key cost driver. Every point of rate reduction meaningfully lowers total interest. If you have multiple debts, prioritize higher-rate balances first (avalanche method) to minimize total interest. This calculator models a single debt with monthly compounding -- consolidation or balance transfer scenarios require separate modeling.

INPUTS & ASSUMPTIONS

Current Balance	**$8,500**
Annual Interest Rate	**22.99%**
Monthly Payment	**$350.00**
Extra Monthly Payment	**$100.00**
Region	**United States**

DETAILED RESULTS

Months to Payoff	**33 months**
Debt-Free Date	**March 2029**
Total Paid	**$11,550**
Total Interest	**$3,050**
Month-1 Interest	**$162.85**
Month-1 Principal	**$187.15**
+$100/mo Saves (Interest)	**$750**
+$100/mo Saves (Time)	**9 months**
+$100/mo Debt Free	**June 2028**
Extra $100.00/mo Saves	**$750**
Extra $100.00/mo Debt Free	**June 2028**

KEY DRIVERS / POSSIBLE ADJUSTMENTS

- Interest rate of 22.99% produces $163/month in interest on the opening balance. Reducing the rate by even 2 percentage points would meaningfully decrease total interest cost.
- Extra payments have outsized impact early in the payoff period when the principal is highest. Adding $100.00/month saves $750 and accelerates payoff by 9 months.
- Total interest of $3,050 represents 26.4% of total repayment cost. Maintaining payments and avoiding new charges will keep this burden under control.

METHODOLOGY

What this calculator models:

- Simulates month-by-month debt repayment with monthly compounding: interest = (annualRate / 12) x balance. Each payment first covers accrued interest; the remainder reduces principal. Simulation continues until balance reaches $0.
- Annual fees (if entered) are distributed as a monthly charge added to each payment obligation.
- Acceleration scenarios computed by adding $100/month (fixed comparison) or the user-entered extra payment to the base monthly payment and re-running the simulation.

What this calculator does not model:

- Multiple debts or consolidated payoff strategies (avalanche or snowball).
- Balance transfers, promotional 0% rates, or refinancing to a lower rate.
- Minimum payment requirements that may increase as the balance falls.
- Late payment penalties, NSF fees, or credit score impact.
- Tax deductibility of interest (e.g., home equity debt in some jurisdictions).

EDUCATIONAL DISCLAIMER

This report is for educational and illustrative purposes only. The payoff simulation uses monthly compounding and does not account for variable interest rates, minimum payment changes, or lender-specific terms. Actual payoff timeline depends on your lender agreement. This does not constitute financial or debt counselling advice. If you are experiencing financial hardship, consult a non-profit credit counsellor.
