AI-ASSISTED FIRE READINESS SUMMARY

Congratulations -- based on your current assets of \$1,800,000, you have already reached your FIRE target of \$1,500,000 (25x annual expenses, 4% rule). Your Financial Independence Progress is 120% of target.

At undefined% assumed annual return (Monthly compounding), investing \$3,000.00/month from a starting base of \$1,800,000 is projected to reach \$1,800,000 at the FIRE date -- composed of \$1,800,000 in initial assets, \$0 in total contributions, and \$0 in estimated investment growth. Financial Independence Readiness Score: 96/100 (Excellent).

Your projected portfolio at the FIRE date exceeds your target. Maintaining your current savings rate and assumed return will keep you on this trajectory. This projection does not account for Social Security, pension, or other income that may reduce the required portfolio size.

INPUTS & ASSUMPTIONS

Current Age	52
Current Invested Assets	\$1,800,000
Monthly Investment	\$3,000.00/month
Annual Expenses	\$60,000
Expected Annual Return	undefined%
Compound Frequency	Monthly
FIRE Multiple	25x (4% rule)
Region	United States

DETAILED RESULTS

Projected at FIRE Date	\$1,800,000
Total Contributions	\$0
Est. Investment Growth	\$0
Readiness Score	96/100 (Excellent)

KEY DRIVERS / POSSIBLE ADJUSTMENTS

- Annual expenses (\$60,000) are the single most powerful FIRE lever. Every \$1 reduction in annual spending reduces your FIRE target by \$25 and increases your effective savings rate simultaneously.
- Monthly investment of \$3,000.00/month compounds to \$0 in contributions by the FIRE date. Increasing contributions by 10% meaningfully compresses the timeline.
- The 25x multiple (4% rule) determines the target portfolio size. Choosing a lower multiple (e.g., 20x vs 25x) reduces the target by \$300,000 but implies a higher withdrawal rate in retirement, increasing longevity risk.

METHODOLOGY

What this calculator models:

- Calculates the FIRE target as annual expenses multiplied by the selected FIRE multiple (25x). Uses a binary-search solver to find the exact month when the projected portfolio reaches the FIRE target.
- Applies Monthly compounding at undefined% annual return using an effective monthly rate conversion. Portfolio grows from initial assets plus monthly contributions.
- Readiness Score (0-100) reflects current progress percentage and time-to-FIRE efficiency. Not a guaranteed outcome indicator.

What this calculator does not model:

- Social Security, pension, or other income offsets.
- Inflation adjustment on expenses or FIRE target.
- Taxes on investment withdrawals or capital gains.
- Sequence-of-returns risk or variable market returns.
- Withdrawal phase (decumulation) portfolio modeling.
- Fees or investment costs on growth returns.

EDUCATIONAL DISCLAIMER

This report is for educational and illustrative purposes only. The FIRE projection uses a fixed assumed return and does not account for market volatility, taxes, inflation, CPP/OAS or Social Security income, or sequence-of-returns risk. The widely-cited 4% rule (25x multiple) is an educational guideline, not a guarantee. Actual financial independence depends on personal circumstances, spending, and market conditions. This does not constitute financial, tax, or investment advice. Consult a qualified financial advisor.
