CA\$800,000	CA\$40,000	30 yrs	68/100	72/100
Starting Portfolio	Annual Withdrawal	Years Lasting	Sustainability Score	Withdrawal Pressure Score
			Watch	Moderate

ESTIMATED WITHDRAWAL BREAKDOWN (PROJECTED)

Total projected: CA\$800,000

Est. Total Withdrawn: CA\$1,620,000 (100.0%)

Remaining Balance: CA\$185,000 (0.0%)

AI-ASSISTED WITHDRAWAL SUSTAINABILITY SUMMARY

Based on a starting portfolio of CA\$800,000 with annual withdrawals of CA\$40,000 (5.0% first-year withdrawal rate), the simulation projects 30 years of sustainable withdrawals at 6% annual return and 2.5% inflation. The portfolio is estimated to last the full 30-year simulation horizon without depletion. Sustainability Status: Watch (Score: 68/100).

A first-year withdrawal rate of 5.0% is in the moderate range. Rates between 3.5% and 5% carry some longevity risk, especially with higher inflation or lower returns than assumed. With 2.5% annual inflation, your CA\$40,000 first-year withdrawal grows to approximately CA\$49,955 at year 10, CA\$63,946 at year 20, and CA\$81,856 at year 30. Withdrawal Pressure Score: 72/100 (Moderate).

This simulation uses a fixed annual return of 6% and does not account for CPP, OAS, or pension income, taxes on withdrawals, or RRIF minimum rules. Actual portfolio longevity depends on market variability, tax treatment, and income from other sources not modeled here.

INPUTS & ASSUMPTIONS

Starting Portfolio	CA\$800,000
Annual Withdrawal	CA\$40,000
Assumed Annual Return	6%
Inflation Rate	2.5%
Current Age	62
Withdrawal Start Age	65
Target Ending Balance	\$0 (deplete fully)
Withdrawal Timing	End of Year
Region	Canada

DETAILED RESULTS

Years Lasting	30
Depletion Age	Not depleted
First-Year Withdrawal Rate	5.0%
Sustainability Status	Watch
Sustainability Score	68/100
Withdrawal Pressure Score	72/100 (Moderate)
Est. Total Withdrawn	CA\$1,620,000
Remaining Balance	CA\$185,000
Withdrawal at Year 10	CA\$49,955.00
Withdrawal at Year 20	CA\$63,946.00
Withdrawal at Year 30	CA\$81,856.00

KEY DRIVERS / POSSIBLE ADJUSTMENTS

- A first-year withdrawal rate of 5.0% is the primary longevity driver. Maintaining this rate or reducing it as returns allow improves sustainability.
- Your 2.5% inflation assumption means withdrawals nearly double every 29 years under the Rule of 72. Inflation is a significant long-term portfolio drain.
- The portfolio survives the full 30-year horizon, ending with approximately CA\$185,000 remaining. Maintaining your return assumption and inflation discipline preserves this outcome.

METHODOLOGY

What this calculator models:

- Simulates year-by-year portfolio withdrawals starting at age 65, applying 2.5% annual inflation to increase withdrawal amounts each year. Withdrawal timing is end-of-year.
- Applies 6% fixed annual return to the portfolio balance before or after withdrawals, depending on the selected timing. The simulation runs for up to 50 years or until the portfolio falls to the target ending balance.
- Sustainability Score is based on years the portfolio lasts (0-100 scale). Withdrawal Pressure Score is based on the first-year withdrawal rate independent of the simulation outcome.

What this calculator does not model:

- CPP or OAS income offsets.
- Taxes on RRSP/RRIF withdrawals.
- RRIF minimum withdrawal rules (V2 scope).
- Employer pension or defined-benefit income.
- Sequence-of-returns risk or variable returns.
- Fees or investment costs.

EDUCATIONAL DISCLAIMER

This report is for educational and illustrative purposes only. Results are based on fixed assumed return and inflation rates and do not reflect CPP, OAS, pension income, RRIF minimum withdrawal rules, or taxes on withdrawals. Actual portfolio longevity will vary based on market returns, tax treatment, and personal circumstances. This does not constitute financial, tax, or retirement planning advice. Consult a qualified financial advisor before making withdrawal decisions.
